# WORKFLOW OPPORTUNITY CHECK

A practical guide for improving how work gets done

## START WITH THE WORK

Before recommending a new tool, automation, or AI solution, take a few minutes to understand the work itself.

Use these questions when looking at a process in a job, internship, consulting project, research setting, student organization, or other workplace experience.

## 1. UNDERSTAND THE WORK

**What work are we trying to improve?**

Describe the purpose of the process, not just the individual task.

**Who experiences the process?**

Consider the people doing the work as well as the customers, employees, managers, students, or others affected by it.

**Where is the friction?**

Look for delays, repetitive work, handoffs, missing information, duplicate entry, unclear ownership, errors, rework, or lack of visibility.

---

## 2. DEFINE WHAT BETTER LOOKS LIKE

**What outcome should improve?**

Examples might include:

- Time or cycle speed
- Quality or accuracy
- Employee experience
- Customer or client experience
- Visibility or coordination
- Cost or effort
- Risk or consistency
- Capacity for higher-value work

**How would we know it improved?**

Identify something observable or measurable rather than assuming that implementing technology equals improvement.

---

## 3. CONSIDER THE INTERVENTION

**What is contributing to the problem?**

Consider whether the primary issue involves:

## 3. CONSIDER THE INTERVENTION (CONTINUED)

**People** — skills, capacity, expectations, decision rights
**Process** — steps, handoffs, approvals, exceptions
**Information** — access, quality, visibility, duplication
**Technology** — tools, systems, integrations, reporting

**Could existing technology help?**
Before adding something new, determine whether capabilities already available could address the problem.

**Is automation or AI appropriate?**
Consider whether the work is sufficiently clear, repeatable, safe, and valuable to automate or augment.

**What should remain human?**
Identify where context, judgment, relationships, accountability, creativity, or professional expertise still matter.

### ONE QUESTION TO REMEMBER

*Are we using technology to make the existing process faster, or to make the work better?*

**About Apprendii**
Apprendii helps organizations improve how work gets done, build confidence with AI, and turn technology investments into practical business value.
